Lesson Plan

- NABCEP Practice Exam #2 Next week
- Cont. NABCEP Learning Objectives:
PV System Sizing Principles

Calculating Module Efficiency

- Efficiency is around 14%. (How to check answer)
- Our modules are rated at 1000W/m²
- Formula: $\frac{W / \text{sq meters}}{1000\text{W/m}^2} = \% \text{ Eff.}$

Convert modules dimensions to meters

1 meter = 3.28084 ft

1 foot = 0.3048 m

1 meter = 39.37008 in

1 inch = 0.0254 m

Example Problem:

1 module is 3 ft x 5 ft = 15 sq. ft.

1 module is 0.9144 m x 1.524 m = 1.394 sq m

200 W / 1.394 sq m = 143.47 W per sq m

and then divide 143.47 w per m sq / 1000 w per m sq =
0.14347 or 14.347 % Efficient

- The battery-bank sizing worksheet uses information from the load analysis to determine the required size of the battery bank.

Battery-Bank Sizing

BATTERY-BANK SIZING

Average Daily DC Energy Consumption for Critical Design Month Wh/day

DC System Voltage VDC

Autonomy days

Required Battery-Bank Output A-h

Allowable Depth-of-Discharge

Weighted Operating Time hrs

Discharge Rate hrs

Minimum Expected Operating Temperature °C

Temperature/Discharge Rate Derating Factor

Battery-Bank Rated Capacity A-h

Selected Battery Nominal Voltage VDC

Selected Battery Rated Capacity A-h

Number of Batteries in Series

Number of Battery Strings in Parallel

Total Number of Batteries

Actual Battery-Bank Rated Capacity A-h

Load Fraction

Average Daily Depth-of-Discharge

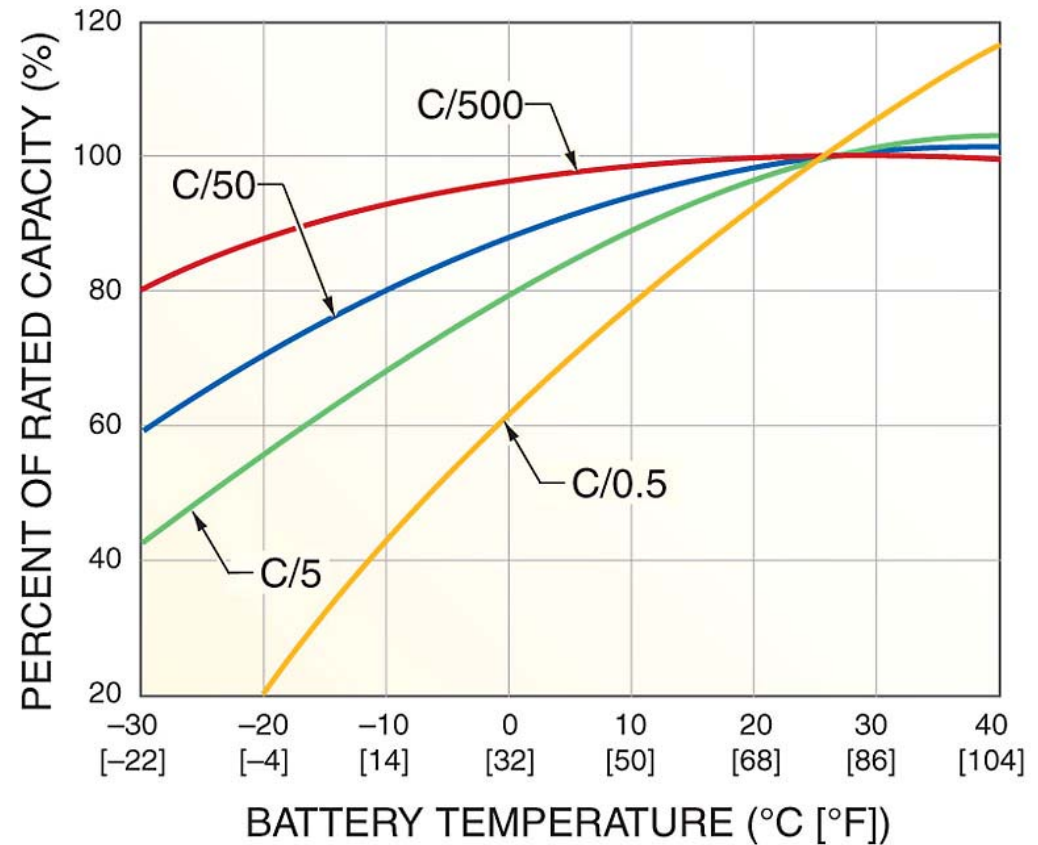

Battery-Bank Capacity

- Due to the allowable depth-of-discharge, low temperatures, and high discharge rates, the amount of useful output in a battery bank is less than the rated capacity.

- The amount of useful output from a battery bank depends partly on the operating temperature and discharge rate. These factors may have different effects for different batteries.

Battery Capacity Loss

- Batteries are configured in series and parallel to match the battery-bank rated capacity needed to produce the required output.

Battery-Bank Configurations

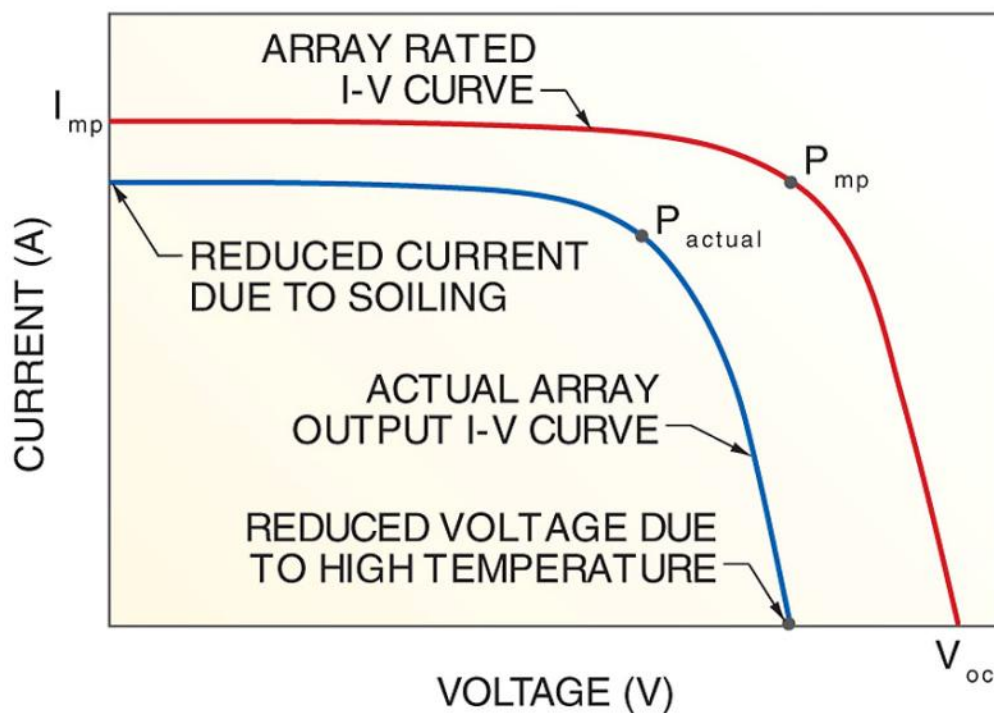

- The array sizing worksheet uses insolation data and load requirements to size the array.

Array Sizing

ARRAY SIZING

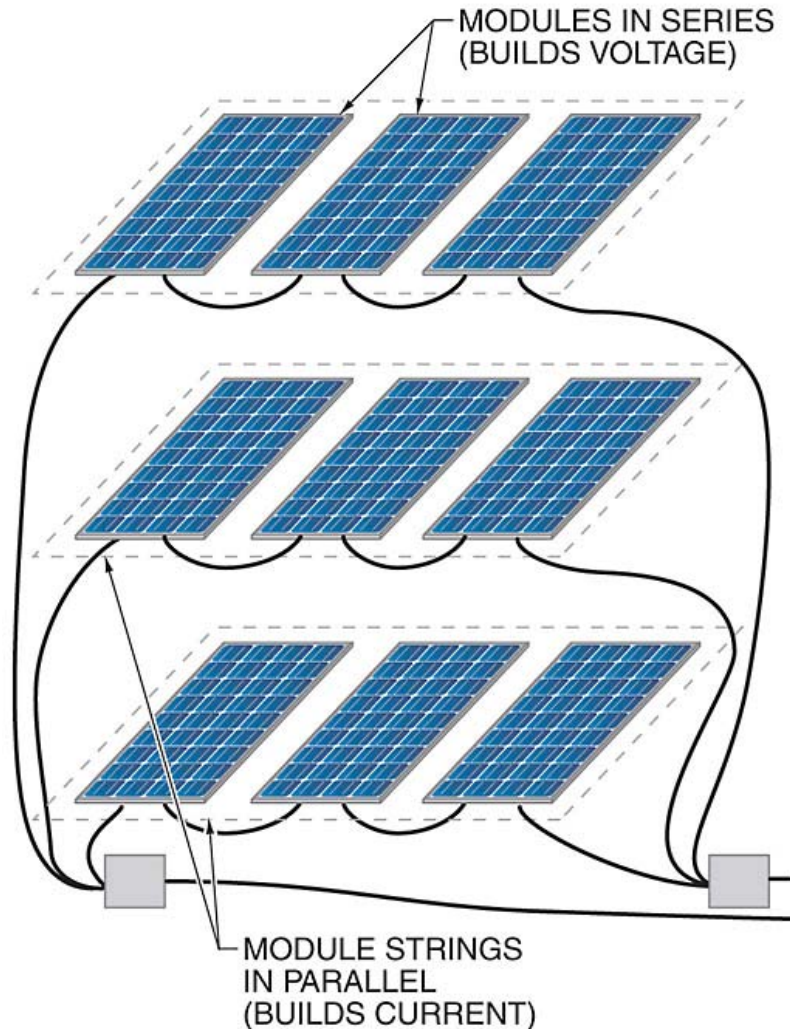

Average Daily DC Energy Consumption for Critical Design Month	<input type="text"/>	Wh/day
DC System Voltage	<input type="text"/>	VDC
Critical Design Month Insolation	<input type="text"/>	PSH/day
Battery Charging Efficiency	<input type="text"/>	
Required Array Maximum Power Current		A
Soiling Factor	<input type="text"/>	
Rated Array Maximum Power Current		A
Temperature Coefficient for Voltage		/°C
Maximum Expected Module Temperature	<input type="text"/>	°C
Rating Reference Temperature	<input type="text"/>	°C
Rated Array Maximum Power Voltage		VDC
Module Rated Maximum Power Current	<input type="text"/>	A
Module Rated Maximum Power Voltage	<input type="text"/>	VDC
Module Rated Maximum Power	<input type="text"/>	W
Number of Modules in Series		
Number of Module Strings in Parallel		
Total Number of Modules		
Actual Array Rated Capacity		W

Array Output Loss

- Actual array output is often less than rated output due to soiling and high temperatures.

Array Configurations

- Modules are configured in series and parallel to match the array rated capacity needed to produce the required output.
